

Virtual Map

Allows you to create an interactive seating chart of the stadium/arena, however this can be used for other purposes as well.

Creating a Virtual Map

1. Click on New.
2. Enter a name for the virtual map; this will not display on the website.
3. Upload the graphic that will be used as the main image/venue. This image needs to be sized to approximately 500 px, though the size will vary depending on the size of the website. It must be resized prior to uploading it.
4. Disable Mouseover Layer – yes/no- If you select 'Yes' on this, it will disable feature that allows for the image and text box to appear when you hover over different sections. An example of when you would want to disable this feature is if you were using the Virtual Map component to create an splash page. In this case, you would not want a box to appear when you hover over the different links.
5. Preview Image – this will open a preview of your virtual map in a separate browser
6. Save. This will take you back to the main Virtual Map page.
7. Click on Edit on the virtual map you just created.
8. When you open this, you will have a section below that says Sector Editor, which will display your image.
9. To sector off an area, click on that section and a red square will appear on the image, and as you add more squares, a blue dotted line will connect them and create a border. You do not have to connect the last square to the first one you created; the system will automatically complete the outline.
10. When you are finished creating the sector, you will find a section below that says New Sector. In this section, add the following:
 - a. Name – this will appear on the website when the user hovers over that section (i.e. Section 112)
 - b. Enter a URL, if applicable – if you want to make this section clickable to another page, enter the URL.
 - c. Upload an image for this section using the Select button. This is where you will load a picture of what it looks like to site in that section. (These images don't have to be re-sized like the main image, but they should be no smaller than 200 px.)
 - d. Description – allows you to enter more information, if applicable. This will show up when the user hovers over that section (i.e. how much tickets are for that section).
 - e. Save. Once you save, you can sector off your next section.
 - f. Repeat these steps until you have finished creating all the sectors.

Editing a Sector

Click on the name of the sector to edit any of the information. If you need to edit the sector border, click on the orange Redraw Sector button at the top of the screen.
